JAVASCRIPT ARRAYS EXERCISE

A URL in web is made of many components as shown in the picture below:

In this exercise, complete the javascript function called "decode_url" below where the input url is provided in a variable called "url" (Note: the variable can be changed so do not put the values manually).

The output of the function should look like this (use document.write function for output)

> **Protocol: HTTP**
> **Server Name: www.kfu.edu.sa**
> **Depth of the File: 2**
> **Name of the File: new**
> **Extension of the File: php**

Note: Depth of the file is the number of folders in the path after the server name and before the filename
